

## TOEM Series

*Heat transfer pumps  
for heat transfer oils from - 100 °C up to 350 °C*

*with magnetic coupling  
bearing brackets 360 and 470*

# Pumps for heat transfer technology

## Main applications

- » Tempering in plastics and die cast industry
- » Baking ovens, large frying units as well as in the production of edible oils and dry masses for the food and feedstuff industries
- » Heating calenders and melting pots in the leather and rubber industry
- » Heating stirring and mixing vessels in the production of paints and varnishes
- » Heating tank storage facilities on stationary and FPSE platforms as well as in tankers
- » Heating press lines in the wood and pulp industry
- » Flat glass production
- » Solar power stations and ORC processes

## Usage

These pumps are designed for circulating organic or synthetic heat transfer oils in heat transfer plants in acc. with DIN 4754.

Suitable for media to be pumped with little non-abrasive contaminations

	<b>Spheroidal graphite cast iron version</b>	<b>Stainless steel version</b>
Media	Heat transfer oil / thermal oil	Heat transfer oil / thermal oil
T <sub>min</sub>	- 40 °C	- 100 °C

# High operational safety, optimal design and service-friendly

## Robust design

Torsion-resistant casing cover and ball bearings with lifetime lubrication

### Wearing-resistant SiC sleeve bearing

Solid, hydrodynamically lubricated sleeve bearings made from SiC as tried-and-tested slide material - extremely wear-resistant and good resistance in corrosive media.

### Impellers with back vanes

The back vanes of the impellers significantly reduce the axial thrust and therefore remove strain from the axial bearings considerably. They also keep dirt particles away from the sleeve bearings.

## Clever temperature management

### Optimised cooling of ball bearings and magnetic coupling

A fan blade on the coupling is also used for cooling in the TOEMN series. Here, the generated air flow, in combination with coupling protection and cooling zone, reduces the temperature on the magnetic coupling and ball bearings extremely effectively. On close-coupled pumps of the TOEMA and TOEMI series, the motor fan also cools the bearing shield and therefore also the ball bearings inside it.

## Also suitable for critical applications

### Pumps with magnetic couplings

100% free of leakage and lower maintenance requirements than pumps with mechanical seals.

### Separating can protection guard

Two separating can protection guards on the inner and outer rotor avoid the destruction of the separating can if a sleeve or rolling bearing fails and they ensure that the pump remains hermetically sealed.

### ATEX

All pumps of the TOEG and TOEM series are ATEX certified.

## Optimal design

### Energy efficiency

High energy efficiency secures a lasting competitive edge.

Speck offers the important criteria for energy-optimised design. Seamless range of sizes, highly efficient impellers, switching of impellers for the best design at the operating point and, naturally, motors in accordance with IE3.

### Optimal sizes of magnetic couplings

Magnetic couplings in staged sizes guarantee optimal design at the operating point with minimal viscosity and eddy current losses.

## Maintenance-friendly and flexible

### Simple installation

All series are extremely maintenance-friendly thanks to easy-to-remove bearing brackets.

You can replace the sleeve bearing cartridge easily as a complete spare part. It is quick and ensures correct installation every time.

### Minimum spare parts stock

The high level of interchangeability of identical parts guarantees minimal spare parts stock requirements and an extremely high level of flexibility.

Retrofitting to a different series is also no problem at all - the volute casing can even be left in the system.

### Safe

The separating can remains hermetically sealed at bearing failures thanks to separating can protection

### Robust and service-friendly

Solid sleeve bearing cartridge with SiC - can be replaced as a complete spare part

### Temperature management

Cooling zone  
Fan blades (TOEMN only)

### Optimal design

Magnetic couplings in staged sizes for optimal design with minimal viscosity and eddy current losses

# Longer lifetime

There are effects, which have little or no relevant impact on smaller designs, but lead to increased wear in larger pumps.

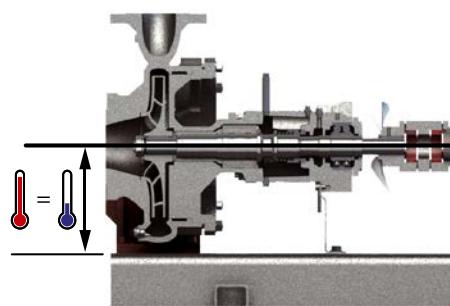

Speck offers larger pumps with special designs to guarantee a longer lifetime: Casing with centreline mounting and double volute.

*Centreline mounting relieves strain from the bearings and coupling*

Casings with feet: The larger the pump, the more strain placed on the bearings and magnet coupling by heat expansion.

Casings with feet can only expand upwards in high temperatures, which causes the pump to tilt and bend. This has an impact on the magnetic coupling and the shaft coupling in particular. As the heat expansion increases with larger casing sizes, the shaft couplings and, eventually the separating can protection guards, wear faster on larger pumps.

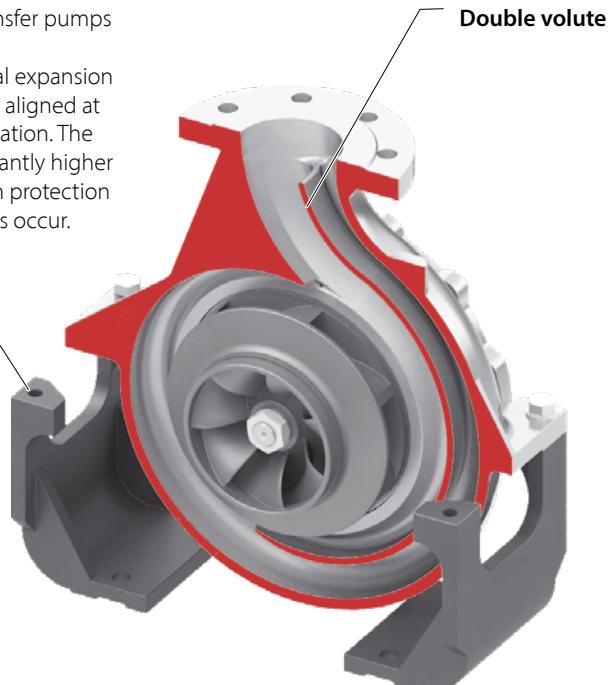

The centreline mounting eliminates the impact of the heat expansion completely.

Speck is the only manufacturer to use a centreline mounting for heat transfer pumps volute casings (PN 16). It eliminates the impact of vertical expansion completely. The shafts are always aligned at optimal height, even in hot operation. The shaft coupling achieves a significantly higher lifetime and intact separating can protection guards still work if bearing failures occur.

*A double volute remove strain from the sleeve bearings*

Radial forces are applied directly on the sleeve bearings. The forces increase with higher impeller diameters and higher speeds. This is why the sleeve bearings on larger pumps with single volute casings wear faster.

Speck therefore uses casings with double volute for larger pumps, which significantly reduce the radial forces. The strain on the radial and axial bearings is considerably reduced, helping them achieve a much longer lifetime.

# Design

## Magnetic couplings

The magnetic coupling consist of inner magnetic rotor, separating can and outer magnetic rotor.

The large numer of staged sizes and a modern design software guarantee the best design at the operating point. The transmissible torques of the magnetic couplings range between 10 and 500 Nm.

### Type code

			Bearing bracket		

## Maintenance-friendly and safe design

### Assemblies are easy-to-replace spare parts

The cartridge insert (TOEMN) or assembly unit (TOEMA, TOEMI) are the parts of the pump getting in touch with the medium to be pumped. They can be removed easily from the volute casing without dismantling the pipes. Both are available as a single spare part and the best choice for quick and falseless repair. We recommend to put at least one cartridge insert/assembly unit into stock.

Further subassemblies are designed in the same way. In the event of servicing, they can be ordered and replaced as a single spare part.

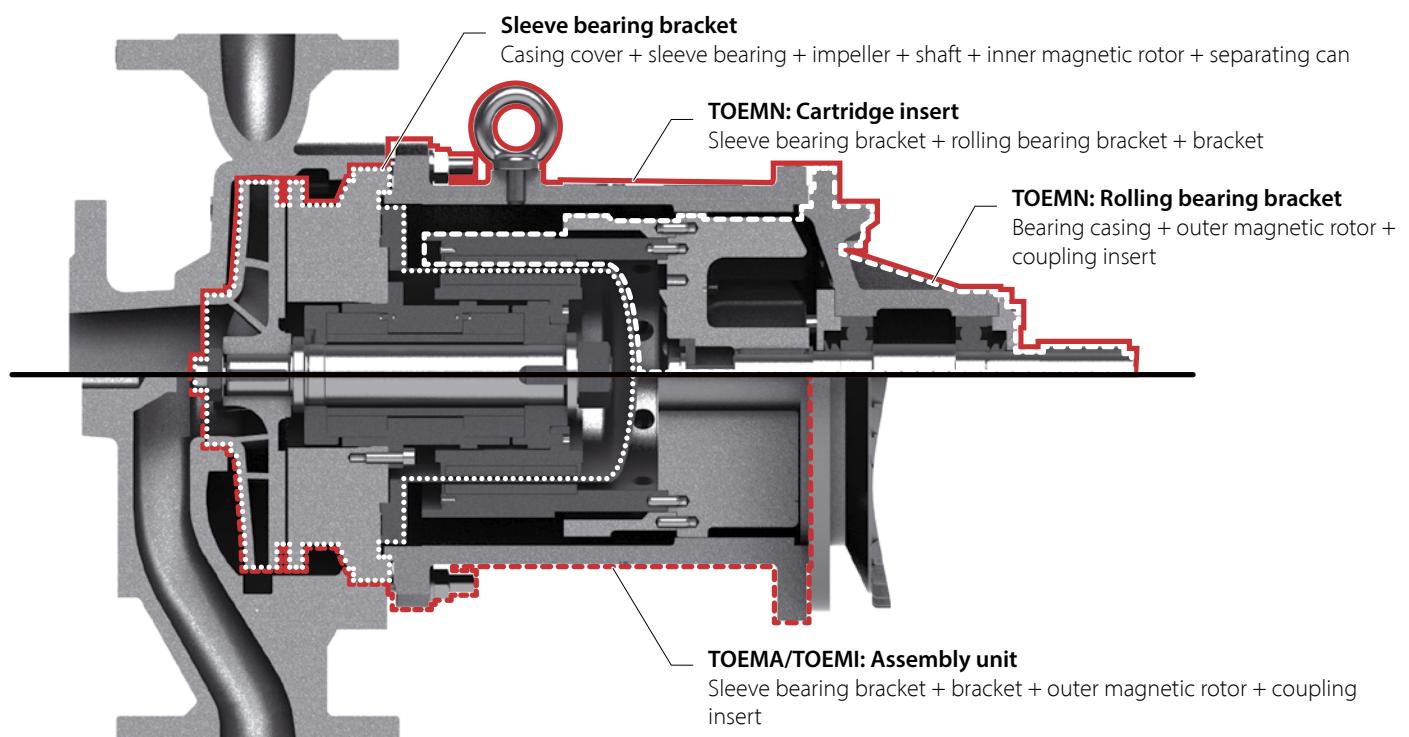

### Flushing bore holes

Current eddy, viscosity and bearing friction losses lead to higher temperatures within the pump and have to be added to the media temperature. Flushing bore holes in the inner rotor and the casing ensure that these critical places are cooled by the medium to be pumped. In addition, light ends are discharged from the inner rotor.

### Temperature control

If required (e.g. in potentially explosive areas), temperature sensors can be installed in the bracket to control the surface temperature of the separating can.

## Assemblies

# Order-related tests

## Pressure tests

Speck carries out the tests below as standard:

### Gas pressure test

The gas pressure test is used to prove that the components are leak-proof. All components that bear pressure are tested, such as the volute casing, casing cover and mechanical seal casing. The test is carried out with forming gas at 2 bar. The holding time is 15 minutes.

### Hydrostatic pressure test

The hydrostatic pressure test is used to prove strength of the components and that the pump is leak-proof. The fully assembled pump is tested. The test is carried out with a hydrostatic test pressure based on prEN 12162.

If you want to use pressure tests according to different criteria, please enter them in the request.

## Testing the performance

At the customer's request, Speck offers the following tests:

### Hydraulic test

Measurement according to DIN EN ISO 9906, Class II

### NPSH test

In this test, the suction-side pressure is gradually reduced until the decrease in the delivered head reaches 3 % at a constant flow rate. At least four flows are evaluated that are spread appropriately over the admissible operating range. The NPSH value is not a guarantee point.

### Vibration test

Vibration test according to EN ISO 5199, Edition 2002

The vibration values are measured radially and vertically at every operating point on the bearing casing at the nominal speed and with the corresponding flow rate.

### Temperature measurement

The measurement is taken on the motor-side bearing at operating temperature. The operating temperature and the ambient temperature at every operating point measured are documented.

Computer-controlled and fully automated test stands on the premises of Speck in Roth.

Measuring of hydraulics, power requirements, axial thrust, vibrations and NPSH values. Heads of up to 400 m and flow rates of up to 750 m³/h are possible.

# Further data and notes

## Standard conditions at site

- » Ambient temperature from - 20 °C to + 40 °C
- » Permissible altitude up to 1000 m above seal level

Deviations from the site conditions specified herein must already be disclosed in the inquiry.

## Painting

The pumps are coated with highly heat-resistant white aluminium paint, colour code RAL 9006.

## Dimensioning

### Assessment of the maximum pump outlet pressure

The pump outlet pressure at the pump nozzle depends on

- » the pump inlet pressure
- » the maximum total head of the selected impeller diameter
- » the density of the medium to be pumped

The maximum pump outlet pressure  $p_{2\max op}$  is calculated using the formula:

$$p_{2\max op} = p_{1\max op} + \rho \cdot g \cdot H \cdot 10^{-5}$$

With:

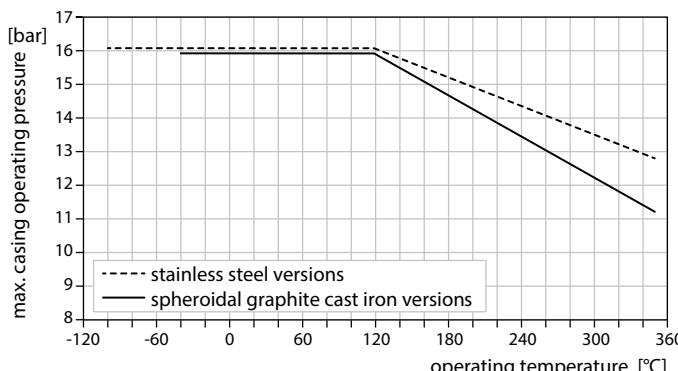

- |                |   |   |
|----------------|---|---|
| $p_{2\max op}$ | = | maximum pump outlet pressure [bar]  |
| $p_{1\max op}$ | = | maximum pump inlet pressure [bar]   |
| $\rho$         | = | density of the medium to be pumped [ $\text{kg/m}^3$ ]  |
| $g$            | = | gravitation constant [ $\text{m/s}^2$ ]   |
| $H$            | = | maximum total head at zero flow or at the peak of the pump's characteristic curve at the selected impeller diameter [m] |

Pumps must be selected and operated in a way which ensures that the maximum pump outlet pressure does by no means exceed the maximum permissible operating pressure of the casing  $p_{all w c}$  at operating pressure.

This also applies to commissioning while the discharge valve is closed (refer to diagram).

### Pressure and temperature limitations

The maximum casing operating pressure  $p_{all w c}$  of the pressure retaining parts depends on the operating temperature:

Maximum permissible casing operating pressure  $p_{all w c}$

## SPAIX selection program

### Ideal for system planners

We make the program available to authorised customers who can pre-select the pumps within their system.  
The web-based software always accesses an up-to-date database.

### Easy pre-selection

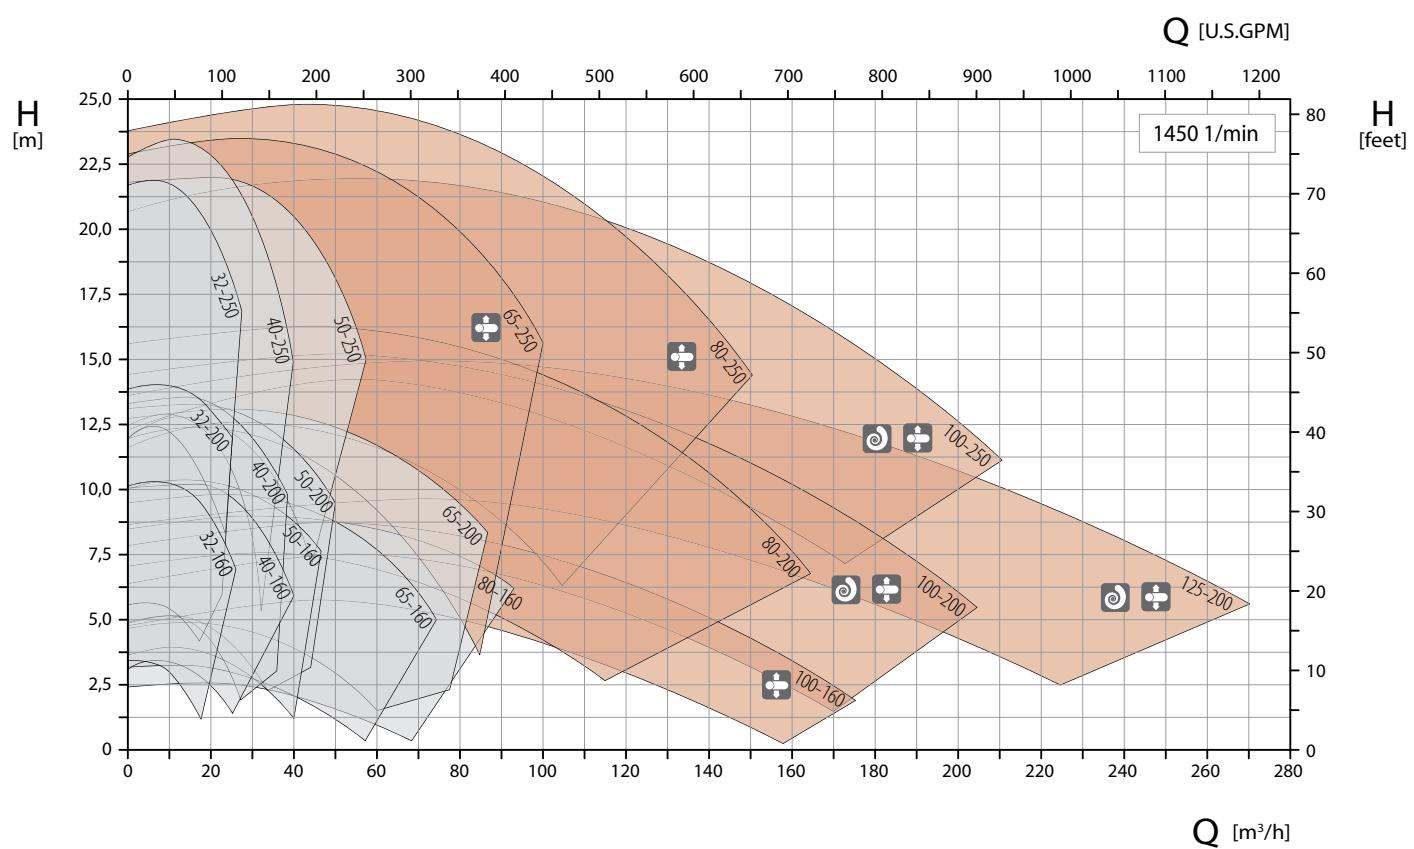

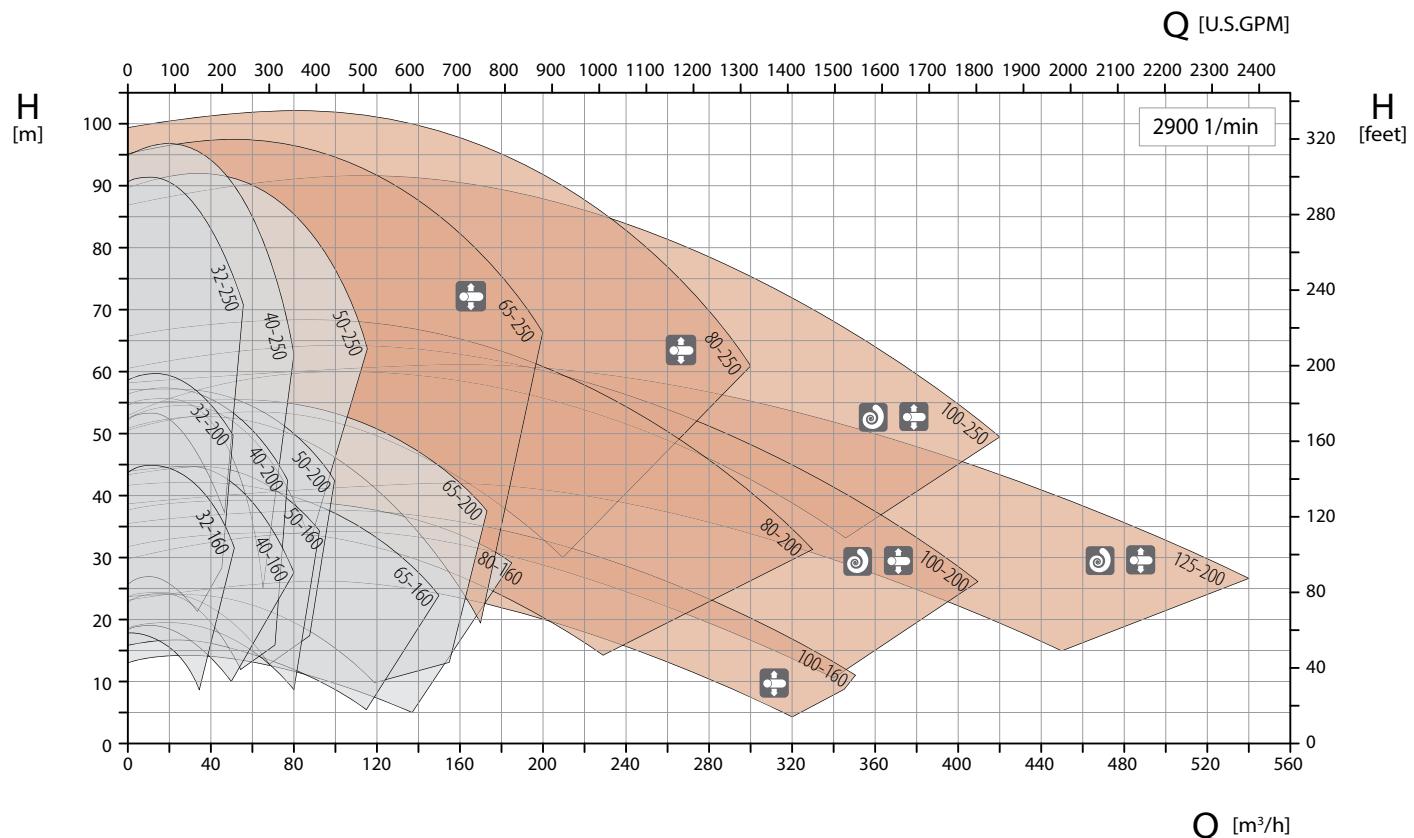

The configuration system avoids a wide range of selection parameters with regard to design, sealing systems, hydraulics, operating conditions and media.  
The software has language options for German and English.

### Checking the pre-selection

When the order is submitted, the customer's choices are double-checked to ensure that your project requirements are met.

Magnetic coupling complete <sup>1</sup>	847	MN MA MI						1 <sup>1</sup>									2 <sup>1</sup>				
further parts	-	MN MA MI							1								2				

<sup>1</sup> Interchangeable with identical sizes of magnetic coupling only.

# Pumps for heat transfer technology

*Centrifugal pumps  
with mechanical seal*

**Modular system**

TOEG and TOEM series mean a consistent designed modular system. Hydraulics and the main part of the used components are identical and interchangeable.

## TOEG Series

These pumps are designed for circulating organic or synthetic heat transfer oils in heat transfer plants in acc. with DIN 4754, as well as hot water.

Suitable for media to be pumped with little non-abrasive contaminations

	<b>Thermal oil versions</b>	<b>Hot water versions</b>
Media	Heat transfer oil / thermal oil	Water
T <sub>min</sub>	- 30 °C	-
T <sub>max</sub>	+ 350 °C	+ 160 °C, + 180 °C on request
Casing	Spheroidal graphite cast iron	Spheroidal graphite cast iron or stainless steel
Nominal pressure	PN 16	PN 25 higher pressures on request
H <sub>max</sub> (2900 min <sup>-1</sup> )	100 m	90 m
Q <sub>max</sub> (2900 min <sup>-1</sup> )	550 m <sup>3</sup> /h	12 m <sup>3</sup> /h (200 l/min) 24 m <sup>3</sup> /h (400 l/min) on request
ATEX	II 3G, II 3D, II 2G, II 2D	II 3G, II 3D, II 2G, II 2D

Description in full length → see brochure TOEG series

*Regenerative turbine pumps  
with magnetic coupling*

**NPY-MK and CY-MK Series**

Tried and tested and compact close-coupled pumps with top/top casings and magnetic coupling. Developed for transporting and circulating organic or synthetic heat transfer oils and hot water. Suitable for pumped media with low amounts of non-abrasive impurities. Suitable for the delivery of gas shares due to the principle of delivery.

	<b>Thermal oil versions</b>	<b>Hot water versions</b>
Media	Heat transfer oil / thermal oil	Water
T <sub>min</sub>	- 100 °C	-
T <sub>max</sub>	+ 350 °C + 400 °C on request	+ 200 °C higher temp. on request
Casing	Spheroidal graphite cast iron or stainless steel	
Nominal pressure	PN 25	higher pressures on request
H <sub>max</sub> (2900 min <sup>-1</sup> )	90 m	
Q <sub>max</sub> (2900 min <sup>-1</sup> )	12 m <sup>3</sup> /h (200 l/min) 24 m <sup>3</sup> /h (400 l/min) on request	
ATEX	II 3G, II 3D, II 2G, II 2D	

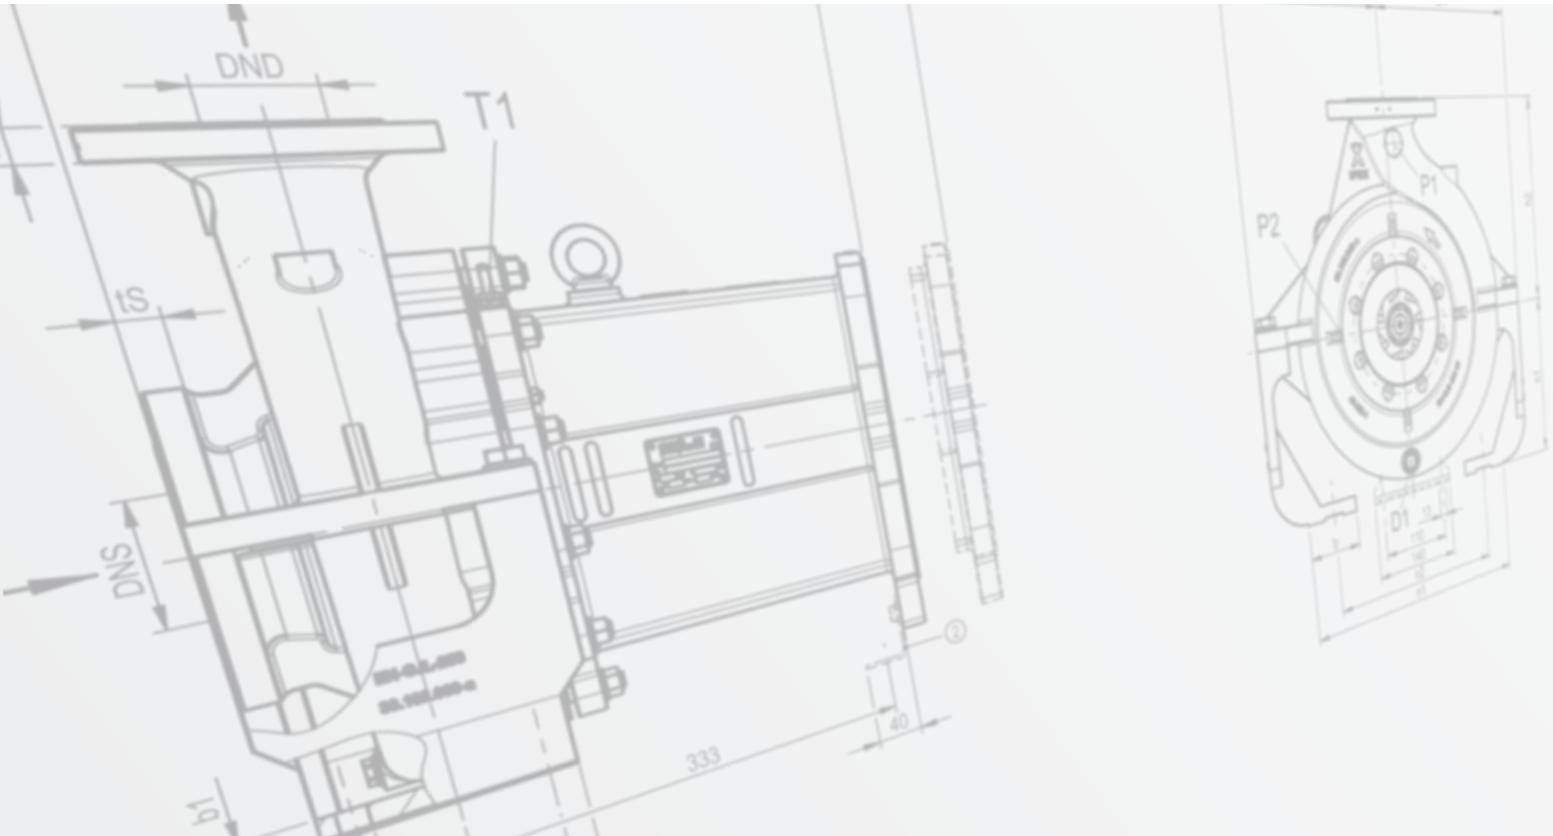

## Compact, robust, durable and safe

Regenerative turbine pumps with magnetic coupling from Speck have been used in a wide range of systems and assemblies successfully for many years. The compact design requires minimal installation space and reduces the weight. The perfected pumps also impress with the small number of extremely high-quality parts.

Robust sleeve bearings made from SiC and ceramic shafts guarantee a long lifetime and are free from leakage and maintenance-free thanks to magnetic couplings.

On request, Speck can also develop special designs for special media or with different hydraulics. Please contact us.
